

FOR IMMEDIATE RELEASE – February 20, 2015

**Image Processing Patent Portfolio Developed by UK High-Tech Company QinetiQ
to be Sold by Munich Innovation Group**

Munich, Germany (February 20, 2015) – Munich Innovation announces the availability of a patent portfolio in the area of image processing and applications in the fields of pattern recognition, image compression and histological assessment.

It consists of 11 granted patent families (10 granted US patents). Nine patent families are relevant for histological assessment, and provide accurate technical solutions for the diagnosis of specific types of cancer. Two patent families offer broadly protected technology in the fields of pattern recognition and image compression.

The medical patents cover different technologies for the automatic assessment of histological image data measuring mitotic activity, pleomorphism and cell grouping. The entire set of patent families is targeted to enhance certain types of cancer diagnosis (e.g. breast cancer) by enhancing and automating the processes of cancer detection, cancer staging and cancer malignance differentiation.

The image compression patent family covers a method of image compression based on wavelet transform that allows compressing each image differently by prioritizing the areas of the image according to the relevance of their specific content.

The pattern recognition method patent family allows to detect the presence of a predetermined object in an image. This represents a use of the protected technology in a wide range of applications, such as the recognition of finger prints or the identification of a specific face or a car in an image taken from a crowd or traffic respectively.

Munich Innovation will be shortly approaching potential buyers of the patent portfolio with a detailed technology report and will be available to discuss the intellectual property in more detail.
